GFD: what's that?

Hydrodynamics in all its complexity plus:

- ▶ Rotating frame
- ▶ Variable density (thermal/stratification) effects
- ▶ Spherical geometry (large- and meso-scales)
- ▶ Fluid in the complex domains (coasts, topography/bathymetry)
- ▶ Multi-phase fluid (water vapor, ice)

But!

Some of these additional effects often allow to **simplify** the analysis

What we lose by supposing hydrostatics
Preliminary conclusions

Fluid dynamics according to Lagrange:

Description in terms of instantaneous positions of **fluid parcels** $\vec{X}(\vec{x}, t)$, along their trajectories, where \vec{x} are initial positions (Lagrangian labels).

Newton's 2nd law:

$$\rho(\vec{X}, t) \frac{d^2 \vec{X}}{dt^2} = -\vec{\nabla} P(\vec{X}, t). \quad (1)$$

Continuity equation:

$$\rho_i(x) d^3 \vec{x} = \rho(\vec{X}, t) d^3 \vec{X}, \leftrightarrow \rho_i(x) = \rho(\vec{X}, t) \mathcal{J} \quad (2)$$

where ρ_i is initial distribution of density of the fluid, $\mathcal{J} = \frac{\partial(X, Y, Z)}{\partial(x, y, z)}$ is the Jacobi determinant d(Jacobian). Fluid velocity: $\vec{v}(\vec{X}, t) = \frac{d\vec{X}}{dt} \equiv \dot{\vec{X}}$.

Fluid dynamics according to Euler:

Description in terms of instantaneous values of the velocity, density and pressure fields at the **fixed point** of space:

$\vec{v}(\vec{x}, t)$, $\rho(\vec{x}, t)$, $P(\vec{x}, t)$. Duality: $\vec{X} \leftrightarrow \vec{x}$

Newton's 2nd law:

$$\rho \left(\frac{\partial \vec{v}}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v} \right) = -\vec{\nabla} P. \quad (3)$$

Continuity equation:

$$\frac{\partial \rho}{\partial t} + \vec{\nabla} \cdot (\rho \vec{v}) = 0. \quad (4)$$

Lagrangian derivative:

$$\frac{d}{dt} = \frac{\partial}{\partial t} + \vec{v} \cdot \vec{\nabla}. \quad (5)$$

Proposition

Lagrangian and Eulerian continuity equations are equivalent

Proof.

$$\frac{d}{dt}(\rho\mathcal{J}) = \frac{d\rho}{dt}\mathcal{J} + \rho\frac{d\mathcal{J}}{dt} = \frac{d\rho_i}{dt} = 0, \quad (6)$$

$$\begin{aligned} \frac{d\mathcal{J}}{dt} &= \frac{\partial(\dot{X}, Y, Z)}{\partial(x, y, z)} + \frac{\partial(X, \dot{Y}, Z)}{\partial(x, y, z)} + \frac{\partial(X, Y, \dot{Z})}{\partial(x, y, z)} \\ &= \left(\frac{\partial(\dot{X}, Y, Z)}{\partial(X, Y, Z)} + \dots \right) \mathcal{J} = \left(\frac{\partial\dot{X}}{\partial X} + \frac{\partial\dot{Y}}{\partial Y} + \frac{\partial\dot{Z}}{\partial Z} \right) \mathcal{J} \Rightarrow \end{aligned}$$

$$\frac{d\rho}{dt} + \rho\vec{\nabla} \cdot \vec{v} = 0 \Leftrightarrow \frac{\partial\rho}{\partial t} + \vec{\nabla} \cdot (\rho\vec{v}) = 0. \quad (7)$$

What we lose by supposing hydrostatics
Preliminary conclusions

Closure of the system: equation of state

General equation of state

$$P = P(\rho, s), \quad (8)$$

where s - entropy per unit mass;

- ▶ **Barotropic** fluid:

$$P = P(\rho) \leftrightarrow s = \text{const}, \quad (9)$$

- ▶ **Baroclinic** fluid:

$$P = P(\rho, s) \Rightarrow \quad (10)$$

Equation for s necessary. **Perfect fluid:**

$$\frac{ds}{dt} = \frac{\partial s}{\partial t} + \vec{v} \cdot \vec{\nabla} s = 0. \quad (11)$$

Reminder: perfect fluid

Dissipative phenomena

What we lose by supposing hydrostatics

Preliminary conclusions

Closure of the system: equation of state

General equation of state

$$P = P(\rho, s), \quad (8)$$

where s - entropy per unit mass;

- ▶ **Barotropic** fluid:

$$P = P(\rho) \leftrightarrow s = \text{const}, \quad (9)$$

- ▶ **Baroclinic** fluid:

$$P = P(\rho, s), \Rightarrow \quad (10)$$

Equation for s necessary. **Perfect fluid:**

$$\frac{ds}{dt} = \frac{\partial s}{\partial t} + \vec{v} \cdot \vec{\nabla} s = 0. \quad (11)$$

Particular case of the barotropic fluid - incompressible fluid:

Volume conservation:

$$\mathcal{J} = 1 \leftrightarrow \vec{\nabla} \cdot \vec{v} = 0 \Rightarrow . \quad (12)$$

pressure is not independent variable.

1. If in addition, $\rho = \text{const}$:

$$\vec{\nabla} \cdot (\vec{v} \cdot \vec{\nabla} \vec{v}) = -\frac{1}{\rho} \vec{\nabla}^2 P. \quad (13)$$

2. Otherwise

$$\frac{d\rho}{dt} = \frac{\partial \rho}{\partial t} + \vec{v} \cdot \vec{\nabla} \rho = 0. \quad (14)$$

et

$$\vec{\nabla} \cdot (\vec{v} \cdot \vec{\nabla} \vec{v}) = -\vec{\nabla} \cdot \left(\frac{\vec{\nabla} P}{\rho} \right). \quad (15)$$

Particular case of the barotropic fluid - incompressible fluid:

Volume conservation:

$$\mathcal{J} = 1 \leftrightarrow \vec{\nabla} \cdot \vec{v} = 0 \Rightarrow . \quad (12)$$

pressure is not independent variable.

1. If in addition, $\rho = \text{const}$:

$$\vec{\nabla} \cdot (\vec{v} \cdot \vec{\nabla} \vec{v}) = -\frac{1}{\rho} \vec{\nabla}^2 P. \quad (13)$$

2. Otherwise

$$\frac{d\rho}{dt} = \frac{\partial \rho}{\partial t} + \vec{v} \cdot \vec{\nabla} \rho = 0. \quad (14)$$

et

$$\vec{\nabla} \cdot (\vec{v} \cdot \vec{\nabla} \vec{v}) = -\vec{\nabla} \cdot \left(\frac{\vec{\nabla} P}{\rho} \right). \quad (15)$$

Thermodynamics: reminder

1st principle, "dry" thermodynamics

$$\delta\epsilon = T\delta s - P\delta v, \quad (16)$$

where ϵ - internal energy per unit mass, $v = \frac{1}{\rho}$ - volume per unit mass.

Enthalpy per unit mass: $h = \epsilon + Pv$:

$$\delta h = T\delta s + v\delta P. \quad (17)$$

Energy density of the fluid:

$$e = \frac{\rho\vec{v}^2}{2} + \rho\epsilon. \quad (18)$$

Local conservation of energy:

$$\frac{\partial e}{\partial t} + \vec{\nabla} \cdot \left[\rho\vec{v} \left(\frac{\vec{v}^2}{2} + h \right) \right] = 0. \quad (19)$$

integrated models

RSW model

Primitive equations (PE)

What we lose by supposing hydrostatics

Preliminary conclusions

Exercise

- ▶ Prove energy conservation and Kelvin theorem for the barotropic fluid
- ▶ Same for the baroclinic fluid
- ▶ Write down, with demonstration, the Euler equations for the incompressible fluid in cylindrical coordinates

Dissipative phenomena: molecular fluxes

Effects of dissipation: correction of the macroscopic fluxes of:

- ▶ momentum
- ▶ mass
- ▶ internal energy (heat)

by the corresponding molecular fluxes, calculated from the **flux - gradient** relations:

$$\vec{f}_A = -k_A \vec{\nabla} A, \quad (24)$$

A - a thermodynamical variable, \vec{f}_A - corresponding molecular flux.

Preliminary
conclusions

Viscosity

Tensor notation

$$\vec{x} \rightarrow x_i, \quad \vec{v} \rightarrow v_i, \quad \vec{\nabla} \rightarrow \partial_i, \quad i = 1, 2, 3. \quad (25)$$

Einstein's convention: repeating indices - summation from 1 to 3.

Conservation of the momentum:

$$\partial_t(\rho v_i) + \partial_k \pi_{ik} = 0, \quad \pi_{ik} = \rho v_i v_k + P \delta_{ik}, \quad \delta_{ik} = \text{diag}(1, 1, 1). \quad (26)$$

Viscous tensions - (density of) the molecular flux of the momentum:

$$\sigma_{ik} = \nu \rho (\partial_i v_k + \partial_k v_i) \Rightarrow \partial_t(\rho v_i) + \partial_k (\pi_{ik} - \sigma_{ik}) = 0, \quad (27)$$

Incompressible case: Navier -Stokes (NS) equation

$$\frac{\partial \vec{v}}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v} = -\frac{\vec{\nabla} P}{\rho} + \nu \vec{\nabla}^2 \vec{v}, \quad \vec{\nabla} \cdot \vec{v} = 0. \quad (28)$$

Reynolds' number

Dimensionless form of the NS equation:

$$\frac{\partial \vec{v}}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v} = -\frac{\vec{\nabla} P}{\rho} + \frac{1}{Re} \vec{\nabla}^2 \vec{v}, \quad (29)$$

$Re = UL/\nu$, U , L -typical velocity- and length-scales.

Remarque: typical Re for synoptic motions $\rightarrow \infty$

conclusions

Diffusivity, thermal conductivity

Molecular fluxes of mass and heat:

$$-D\vec{\nabla}\rho, \quad -\kappa\vec{\nabla}T \quad (30)$$

Corrected continuity equation:

$$\frac{\partial\rho}{\partial t} + \vec{\nabla} \cdot (\rho\vec{v}) = D\vec{\nabla}^2\rho. \quad (31)$$

Equation of heat/temperature

$$\frac{\partial T}{\partial t} + \vec{v} \cdot \vec{\nabla}T = \chi\vec{\nabla}^2T. \quad (32)$$

Motion in a frame rotating with angular velocity $\vec{\Omega}$

Material point in the rotating frame:

$$m \frac{d\vec{v}}{dt} + 2m\vec{\Omega} \wedge \vec{v} + m\vec{\Omega} \wedge (\vec{\Omega} \wedge \vec{x}) = \vec{F}, \quad \vec{v} = \frac{d\vec{x}}{dt} \quad (33)$$

m - mass, \vec{x} -current position of the point, \vec{F} - sum of forces acting on the point

Euler equations in the rotating frame +gravity:

Fluid under the influence of gravity: $m \rightarrow \rho$,
 $\frac{d}{dt} \rightarrow \frac{\partial}{\partial t} + \vec{v} \cdot \vec{\nabla}$, forces: pressure + gravity \Rightarrow

$$\frac{\partial \vec{v}}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v} + 2\vec{\Omega} \wedge \vec{v} = -\frac{\vec{\nabla} P}{\rho} + \vec{g}^* \quad (34)$$

Effective gravity: gravity + centrifugal acceleration (also potential)

$$\vec{g}^* = \vec{g} - \vec{\Omega} \wedge (\vec{\Omega} \wedge \vec{x}) \quad (35)$$

$$\frac{\partial \vec{v}}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v} + f \hat{z} \wedge \vec{v} = -\frac{\vec{\nabla} P}{\rho} + \vec{g} \quad (36)$$

f - plane: $f = \text{const}$; β - plane: $f = f + \beta y$; *f* - Coriolis
parameter: $f = 2\Omega \sin \phi = 2\Omega \sin \theta$

Hydrostatics. Stratification

The state of rest $\vec{v} \equiv 0$ is solution of (36) if **hydrostatic equilibrium** holds:

$$0 = -\frac{\vec{\nabla} P}{\rho} + \vec{g}$$

The continuity equation with time-independent ρ

$$\frac{d\rho}{dt} + \rho \vec{\nabla} \cdot \vec{v} = 0$$

is satisfied in a state of rest.

Statically stable states: $\rho = \rho_0(z)$, $\rho'_0(z) \leq 0 \rightarrow$

$$P = P_0(z) = - \int dz g \rho_0(z)$$

Dependence of ρ_0 on z is called **stratification**.

Exercises

Deduce Euler and continuity equations in spherical coordinates.

Determine conditions of validity of the tangent plane approximation.

By considering displacements of fluid parcels from their positions in the state of rest, demonstrate qualitatively that stratifications with $\rho'_0(z) > 0$ are unstable;

Oceanic stratification

Typical density profile:

$$\rho(\vec{x}, t) = \rho_0 + \rho_s(z) + \sigma(x, y, z; t), \quad \rho_0 \gg \rho_s \gg \sigma. \quad (37)$$

Hydrostatic approximation for large-scale motions:

$$g\rho + \partial_z P = 0, \Rightarrow P = P_0 + P_s(z) + \pi(x, y, z; t), \quad (38)$$

Reminder: perfect fluid

RSW model

Primitive equations (PE)

What we lose by supposing hydrostatics

Preliminary conclusions

Approximations. Non-dissipative equations of motion

Boussinesq approximation

Deviations of density from ρ_0 neglected in the horizontal \rightarrow

$$\frac{\partial \vec{v}_h}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v}_h + f \hat{z} \wedge \vec{v}_h = -\frac{\vec{\nabla}_h \pi}{\rho} \approx -\vec{\nabla}_h \phi, \quad (39)$$

where $\phi = \frac{\pi}{\rho_0}$ - **geopotential**.

Incompressibility of water

Continuity equation splits in two:

$$\vec{\nabla} \cdot \vec{v} = 0, \quad \vec{v} = \vec{v}_h + \hat{z} w. \quad (40)$$

$$\partial_t \rho + \vec{v} \cdot \vec{\nabla} \rho = 0. \quad (41)$$

Vertical boundary conditions

Most often sufficient for our purposes: **rigid lid and flat bottom**:

$$w|_{z=0} = w|_{z=H} = 0 \quad (42)$$

Non-trivial bathymetry : fluid parcels follow the bottom profile

$$w|_{z=b(x,y)} = \frac{db}{dt} = \vec{v} \cdot \vec{\nabla} b$$

Free surface: fluid parcels move with the surface:

$$w|_{z=h(x,y;t)} = \frac{dh}{dt} = \frac{\partial h}{\partial t} + \vec{v} \cdot \vec{\nabla} h$$

What we lose by supposing hydrostatics
Preliminary conclusions

Altitude \leftrightarrow Pressure \Rightarrow vertical coordinate.

Thermodynamics of the dry atmosphere

Equation of state - ideal gas:

$$P = \rho RT, \quad c_{p,V} = T \left(\frac{\partial s}{\partial T} \right)_{P,V} = \text{const}, \quad c_p - c_v = R. \quad (43)$$

Entropy:

$$s = c_p \ln T - R \ln P + \text{const}. \quad (44)$$

Adiabatic process:

$$s = \text{const} \Rightarrow c_p \frac{dT}{T} - R \frac{dP}{P} = 0, \Rightarrow T = T_s \left(\frac{P}{P_s} \right)^{\frac{R}{c_p}}. \quad (45)$$

Potential temperature :

$$\theta = T \left(\frac{P_s}{P} \right)^{\frac{R}{c_p}}, \quad s = c_p \ln \theta + \text{const}. \quad (46)$$

Geopotential and hydrostatics

Geopotential variation: work to lift a unit mass against gravity: $\delta\phi = g\delta z$.

$z = z(p)$ becomes a **thermodynamical variable**.

Hydrostatic approximation:

$$\delta\phi = -\frac{RT}{P}\delta P \Rightarrow \quad (47)$$

$$\frac{\partial\phi}{\partial P} = -\frac{RT}{P} = -\frac{1}{\rho}. \quad (48)$$

Useful relation for **small variations** ρ , P , θ with respect to background ρ_0 , P_0 , θ_0 :

$$\theta = \theta_0 \left[\frac{\left(1 - \frac{R}{c_p}\right) P}{P_0} - \frac{\rho}{\rho_0} \right] \quad (49)$$

Elimination of ρ in Euler equations

"Triangular" relation :

$$\left(\frac{\partial P}{\partial x}\right)_z \left(\frac{\partial x}{\partial z}\right)_P \left(\frac{\partial z}{\partial P}\right)_x = -1 \Rightarrow \quad (50)$$

$$\left(\frac{\partial P}{\partial x}\right)_z = - \left(\frac{\partial P}{\partial z}\right)_x \left(\frac{\partial z}{\partial x}\right)_P = \rho \left(\frac{\partial \phi}{\partial x}\right)_P. \quad (51)$$

Incompressibility in pressure coordinates

Lagrangian volume element in pressure coordinates:

$$\rho dx dy dz = -\frac{1}{g} dx dy dP \quad (52)$$

Mass conservation \Rightarrow Volume conservation in P .

Adiabatic primitive equations

Equations of motion

$$\operatorname{div}(\vec{v}) = \vec{\nabla}_h \cdot \vec{v}_h + \partial_p \omega = 0, \quad \omega = \frac{dP}{dt}. \quad (53)$$

$$\frac{\partial \vec{v}_h}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v}_h + f \hat{\mathbf{z}} \wedge \vec{v}_h = -\vec{\nabla}_h \phi. \quad (54)$$

$$\partial_t \theta + \vec{v} \cdot \vec{\nabla} \theta = 0. \quad (55)$$

$$\frac{\partial \phi}{\partial P} = -\frac{RT}{P} = -\frac{R}{P} \left(\frac{P}{P_s} \right)^{\frac{R}{c_p}} \theta. \quad (56)$$

Boundary conditions

Bottom: ground \equiv **free surface** in terms of pressure, geopotential fixed.

Top: rigid lid \equiv fixed value of pressure, e.g. tropopause.

"Pseudo-height" coordinate

New vertical coordinate:

$$\bar{z} = z_0 \left(1 - \left(\frac{P}{P_s} \right)^{\frac{R}{c_p}} \right) \equiv z_0 \left(1 - \left(\frac{P}{P_s} \right)^{\frac{\gamma-1}{\gamma}} \right), \quad (57)$$

$$z_0 = \frac{\gamma}{\gamma-1} \frac{P_s}{g\rho_s} \approx 28\text{km}. \quad (58)$$

Pseudo- density:

$$r : \quad rd\bar{z} = \rho dz = -\frac{1}{g} dP. \quad (59)$$

Mass conservation:

$$dx dy dP = -g r(\bar{z}) dx dy d\bar{z} \Rightarrow \quad (60)$$

$$r \left(\vec{\nabla}_h \cdot \vec{v}_h + \frac{\partial \bar{w}}{\partial \bar{z}} \right) + \bar{w} \frac{\partial r}{\partial \bar{z}} = 0, \quad \vec{v} = (\vec{v}_h, \bar{w} = \dot{\bar{z}}). \quad (61)$$

Approximation $\bar{z} \ll z_0$:

$$\vec{\nabla}_h \cdot \vec{v}_h + \frac{\partial \bar{w}}{\partial \bar{z}} = -\frac{\bar{w}}{r} \frac{\partial r}{\partial \bar{z}} = \frac{\bar{w}}{(\gamma - 1) z_0 \left(1 - \frac{\bar{z}}{z_0}\right)} \approx 0. \quad (62)$$

What we lose by supposing hydrostatics

Preliminary conclusions

Isentropic coordinates

Montgomery potential

$$\psi = \phi - \frac{\theta}{\theta_0} g \bar{z}, \Rightarrow \quad (66)$$

$$\begin{aligned} d\psi &= d\phi - g \frac{\theta}{\theta_0} d\bar{z} - g \bar{z} d\frac{\theta}{\theta_0} \\ &= \vec{\nabla}_h \phi \cdot d\vec{x}_h + \partial_{\bar{z}} \phi d\bar{z} - \frac{\theta}{\theta_0} g d\bar{z} - g \bar{z} d\frac{\theta}{\theta_0} \\ &= \vec{\nabla}_h \phi \cdot d\vec{x}_h - g \bar{z} d\frac{\theta}{\theta_0} \end{aligned} \quad (67)$$

Therefore:

$$\left(\vec{\nabla}_h \psi \right)_\theta = \left(\vec{\nabla}_h \phi \right)_{\bar{z}}; \quad \partial_\theta \psi = -g \bar{z} / \theta_0 \quad (68)$$

and \bar{z} is a new dependent variable.

Velocity and continuity equations in isentropic coordinates

Velocity

$$\vec{v} \rightarrow \left(\vec{v}_h, \tilde{w} = \frac{d\theta}{dt} \right) \Rightarrow \quad (69)$$

$\tilde{w} \equiv 0$ for adiabatic processes

Mass conservation

$$dx dy d\bar{z} = \frac{\partial \bar{z}}{\partial \theta} dx dy d\theta = \text{const} \rightarrow \quad (70)$$

$$\partial_t \left(\frac{\partial \bar{z}}{\partial \theta} \right) + \vec{\nabla}_h \cdot \left(\frac{\partial \bar{z}}{\partial \theta} \vec{v}_h \right) = 0. \quad (71)$$

Preliminary conclusions

Boussinesq approximation for atmosphere

Background density ρ_0 : Ocean - $\rho_0 = \text{const}$, Atmosphere:

$\rho_0 = \rho_0(z)$; Boussinesq approximation in x, y, z coordinates,

with $\rho = \rho_0(z) + \tilde{\rho}$, $P = P_0(z) + \tilde{p}$, $\theta = \theta_0(z) + \tilde{\theta}$,

(...) omitted below:

$$\frac{\partial \vec{v}_h}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v}_h + f \hat{z} \wedge \vec{v}_h = -\vec{\nabla}_h \phi, \quad (75)$$

with geopotential $\phi = \frac{p}{\rho_0}$. Vertical motion (**non-hydrostatic**):

$$\frac{\partial w}{\partial t} + \vec{v} \cdot \vec{\nabla} w = -\frac{\partial \phi}{\partial z} - \frac{p}{\rho_0^2} \frac{\partial \rho_0}{\partial z} - g \frac{\rho}{\rho_0} \quad (76)$$

Equation of state (ideal gas) + (49) \rightarrow

$$\frac{\partial w}{\partial t} + \vec{v} \cdot \vec{\nabla} w = -\frac{\partial \phi}{\partial z} + b \quad (77)$$

$b = g \frac{\theta}{\theta_0}$ - **buoyancy**, $\frac{\partial b}{\partial t} + \vec{v} \cdot \vec{\nabla} b = 0$ for adiabatic motions.

Continuity equation \rightarrow **anelastic equation**:

$$\vec{\nabla} \cdot (\rho_0(z) \vec{v}) = 0.$$

Conservative form of equations of motion

Full Euler equations + continuity equation \rightarrow

$$\partial_t(\rho u) + \partial_x(\rho u^2) + \partial_y(\rho v u) + \partial_z(\rho w u) - f \rho v = -\partial_x p, \quad (78)$$

$$\partial_t(\rho v) + \partial_x(\rho u v) + \partial_y(\rho v^2) + \partial_z(\rho w v) + f \rho u = -\partial_y p, \quad (79)$$

hydrostatics

Preliminary
conclusions

Hydrostatics and mean-field approximation:

Hydrostatic pressure:

Pressure inside the layer (z_1, z_2) in terms of pressure at the lower surface and vertical position:

$$p(x, y, z, t) = -g \int_{z_1}^z dz' \rho(x, y, z', t) + p|_{z_1}. \quad (88)$$

Closure hypothesis: **mean-field** \equiv **columnar motion**

Weak variations in the vertical, **correlations decoupled**:

$$\langle uv \rangle \approx \langle u \rangle \langle v \rangle, \quad \langle u^2 \rangle \approx \langle u \rangle \langle u \rangle, \quad \langle v^2 \rangle \approx \langle v \rangle \langle v \rangle. \quad (89)$$

Approximate equations

Mean density:

Mean density $\bar{\rho}$:

$$\bar{\rho} = \frac{1}{(z_2 - z_1)} \int_{z_1}^{z_2} dz \rho, \quad \mu = \bar{\rho}(z_2 - z_1). \quad (90)$$

Pressure in terms of $\bar{\rho}$:

$$p(x, y, z, t) \approx -g\bar{\rho}(z - z_1) + p|_{z_1}. \quad (91)$$

Hypothesis: $\bar{\rho} = \text{const}$ in what follows.

conclusions

Omitting the brackets we obtain for the averages from (85), (86), (89), (91), with the help of (87), (90):

$$\begin{aligned} \bar{\rho}(z_2 - z_1)(\partial_t \mathbf{v}_h + \mathbf{v}_h \cdot \nabla_h \mathbf{v}_h + f \hat{\mathbf{z}} \wedge \mathbf{v}_h) = \\ -\nabla_h \left(-g \bar{\rho} \frac{(z_2 - z_1)^2}{2} + (z_2 - z_1) p|_{z_1} \right) \\ -\nabla_h z_1 p|_{z_1} + \nabla_h z_2 p|_{z_2}. \end{aligned} \quad (92)$$

Any variable in this equation is a function only of horizontal coordinates and time. Alternative notation: $\vec{v}_h \equiv \mathbf{v}_h$.

Rotating shallow water (RSW), 2 layers

2- layer configuration, rigid lid

Application of general equations (92) to the fluid between the bottom $z_1 = 0$ and the top $z_3 = H$ planes. Choose a material surface $z = z_2(x, y, t) \equiv h(x, y, t)$ in the fluid interior, $\vec{\nabla}_h \rightarrow \vec{\nabla}$, $\vec{v}_h \rightarrow \mathbf{v}$. Vertical boundaries - material surfaces. Generalisation to non-trivial topography: $z_1 = b(x, y)$.

Equations of motion

$\mathbf{v}_{1(2)}, \bar{\rho}_{1(2)}$ - velocity and density in the inferior (superior) layer.

$$\partial_t \mathbf{v}_2 + \mathbf{v}_2 \cdot \nabla \mathbf{v}_2 + f \hat{\mathbf{z}} \wedge \mathbf{v}_2 = -\frac{1}{\bar{\rho}_2} \nabla p|_H \quad (93)$$

$$\partial_t \mathbf{v}_1 + \mathbf{v}_1 \cdot \nabla \mathbf{v}_1 + f \hat{\mathbf{z}} \wedge \mathbf{v}_1 = -\frac{1}{\bar{\rho}_1} \nabla p|_H - g \frac{\bar{\rho}_1 - \bar{\rho}_2}{\bar{\rho}_1} \nabla h, \quad (94)$$

$$\partial_t h + \nabla \cdot (\mathbf{v}_1 h) = 0, \quad (95)$$

$$\partial_t (H - h) + \nabla \cdot (\mathbf{v}_2 (H - h)) = 0, \quad (96)$$

Re-interpretation of the equations

2-dimensional Euler equations in each layer with **dynamical boundary condition at the interface**:

$$p_1 = (\bar{\rho}_1 - \bar{\rho}_2)gh + p_2, \quad (97)$$

Reduced gravity

Remark: g enter equations uniquely in combination $g \frac{\bar{\rho}_1 - \bar{\rho}_2}{\bar{\rho}_1}$ - **reduced gravity**

Exercise

Deduce the equations (93) - (96).

1-layer rotating shallow water model (Saint-Venant)

In the limit $\bar{\rho}_2 \rightarrow 0$:

$$\partial_t \mathbf{v} + \mathbf{v} \cdot \nabla \mathbf{v} + f \hat{\mathbf{z}} \wedge \mathbf{v} + g \nabla h = 0, \quad (98)$$

$$\partial_t h + \nabla \cdot (\mathbf{v}h) = 0, \quad (99)$$

In the presence of non-trivial topography $h \rightarrow h - b(x, y)$ in the second equation.

Conservation laws, RSW model

Energy

By construction, equations (98), (99) express the local conservation of the horizontal momentum and mass. Energy density:

$$e = h \frac{\mathbf{v}^2}{2} + g \frac{h^2}{2} \quad (100)$$

obeys the conservation equation:

$$\partial_t e + \nabla \cdot \left(\mathbf{v} h \left(\frac{\mathbf{v}^2}{2} + gh \right) \right) = 0, \quad (101)$$

and total energy, $E = \int dx dy e$, is constant for an isolated system.

Potential vorticity, RSW model

Specific Lagrangian conservation law: potential vorticity q (PV), constructed from the **relative vorticity** (vertical component) $\zeta = v_x - u_y$, Coriolis le parametre f , and fluid depth h .

$$q = \frac{\zeta + f}{h}. \quad (102)$$

here $\zeta + f$ - **absolute vorticity**, f - **planetary vorticity**.

Lagrangian conservation:

$$\frac{dq}{dt} \equiv (\partial_t + \mathbf{v} \cdot \nabla) q = 0, \quad (103)$$

is obtained by combining equations of vorticity:

$$\frac{d(\zeta + f)}{dt} + (\zeta + f) \nabla \cdot \mathbf{v} = 0, \quad (104)$$

and continuity

$$\frac{dh}{dt} + h \nabla \cdot \mathbf{v} = 0 : \quad (105)$$

$$\frac{d}{dt} \frac{\zeta + f}{h} = \frac{1}{h} \frac{d}{dt} (\zeta + f) - \frac{\zeta + f}{h^2} \frac{d}{dt} h = 0, \quad (106)$$

Eulerian expression:

Conservation of PV leads to independence of time of any integral:

$$\int dx dy h \mathcal{F}(q), \quad (107)$$

over the whole flow, with \mathcal{F} - arbitrary function.

Qualitative image of the RSW dynamics:

Two-dimensional motion of the fluid columns of variable depth, each preserving its potential vorticity.

Spectrum of small perturbations - RSW model

Linearized equations :

Perturbations about state of rest: $\mathbf{v} = 0$, $h = H_0 = \text{const.}$

Linearised equations in the approximation $f = f_0 = \text{const.}$

$$\begin{aligned}u_t - fv + g\eta_x &= 0, \\v_t + fu + g\eta_y &= 0, \\ \eta_t + H_0(u_x + v_y) &= 0,\end{aligned}\tag{108}$$

where u , v - 2 components of the velocity perturbation, η - perturbation of the interface.

RSW model

Primitive
equations (PE)

What we lose by
supposing
hydrostatics

Preliminary
conclusions

Exercise

1. Demonstrate (104),
2. Obtain the **polarisation relations**, i.e. the relations between u_0, v_0, η_0 for inertia - gravity waves,
3. Calculate phase and group velocity of inertia - gravity waves,
4. Demonstrate that inertia-gravity waves **bear no** PV anomaly (PV anomaly: $q - f/H_0$),
5. Determine the spectrum of small perturbations in the 2-layer RSW model,
6. Demonstrate that PV of each layer in multi-layer RSW is

$$q_i = \frac{\zeta_i + f}{h_i}, \quad i = 1, 2, \quad \frac{d_i q_i}{dt} = 0. \quad (114)$$

Primitive equations, ocean

$$\frac{\partial \vec{v}_h}{\partial t} + \vec{v} \cdot \vec{\nabla} \vec{v}_h + f \hat{z} \wedge \vec{v}_h = -\frac{\vec{\nabla}_h \pi}{\rho} \equiv -\vec{\nabla}_h \phi, \quad (115)$$

$$\partial_t \sigma + \vec{v} \cdot \vec{\nabla} \sigma + w \rho'_s(z) = 0. \quad (116)$$

$$g \frac{\sigma}{\rho_0} = -\partial_z \phi, \quad \vec{\nabla}_h \cdot \vec{v}_h + \partial_z w = 0, \quad (117)$$

Remark

Hydrostatic approximation \leftrightarrow scaling for mesoscale motions:

$$W \ll U, \quad H \ll L, \quad \frac{W}{H} \sim \frac{U}{L}$$

where L , H and U , W are horizontal and vertical spatial and velocity scales, respectively.

Absolute vorticity in PE model

Absolute vorticity:

$$\vec{\zeta}_a = \vec{\zeta} + \hat{\mathbf{z}}f, \quad \vec{\nabla} \cdot \vec{\zeta}_a = 0, \quad (118)$$

where relative vorticity under the PE scaling:

$$\vec{\zeta} = -\partial_z v \hat{\mathbf{x}} + \partial_z u \hat{\mathbf{y}} + (\partial_x v - \partial_y u) \hat{\mathbf{z}} \quad (119)$$

Application of $\vec{\nabla} \wedge$ to PE + "hydrodynamic identity":

$$\vec{v} \cdot \vec{\nabla} \vec{v} = \frac{1}{2} \vec{\nabla} v^2 - \vec{v} \wedge (\vec{\nabla} \wedge \vec{v}) \quad (120)$$

→ evolution equation for ζ_a :

$$\frac{d\vec{\zeta}_a}{dt} = \vec{\zeta}_a \cdot \vec{\nabla} \vec{v} + \frac{g}{\rho_0} \hat{\mathbf{z}} \wedge \vec{\nabla} \sigma. \quad (121)$$

Lagrangian conservation of potential vorticity

$$\frac{dq}{dt} = 0, \quad q = \vec{\zeta}_a \cdot \vec{\nabla} \rho, \quad \rho = \rho_0 + \rho_s(z) + \sigma. \quad (122)$$

Using vector identities:

$$\vec{\nabla} A \cdot (\vec{\nabla} \wedge \vec{B}) = -\vec{\nabla} \cdot (\vec{\nabla} A \wedge \vec{B}), \quad (123)$$

$$\vec{A} \wedge (\vec{B} \wedge \vec{C}) = \vec{B} (\vec{A} \cdot \vec{C}) - \vec{C} (\vec{A} \cdot \vec{B}), \quad (124)$$

and $\vec{\nabla} \cdot \vec{v} = \vec{\nabla} \cdot \vec{\zeta}_a = 0$:

$$\begin{aligned} \partial_t (\vec{\zeta}_a \cdot \vec{\nabla} \rho) &= (\partial_t \vec{\zeta}_a) \cdot \vec{\nabla} \rho + \vec{\zeta}_a \cdot \vec{\nabla} (\partial_t \rho) \\ &= \vec{\nabla} \rho \cdot (\vec{\nabla} \wedge (\vec{v} \wedge \vec{\zeta}_a)) - \vec{\zeta}_a \cdot \vec{\nabla} (\vec{v} \cdot \vec{\nabla} \rho) \\ &= -\vec{\nabla} \cdot (\vec{\nabla} \rho \wedge (\vec{v} \wedge \vec{\zeta}_a)) - \vec{\zeta}_a \cdot \vec{\nabla} (\vec{v} \cdot \nabla \rho) \\ &= -\vec{\nabla} \cdot (\vec{v} (\vec{\zeta}_a \cdot \vec{\nabla} \rho)) + \vec{\nabla} \cdot (\vec{\zeta}_a (\vec{v} \cdot \vec{\nabla} \rho)) \\ &\quad - \vec{\zeta}_a \cdot \vec{\nabla} (\vec{v} \cdot \nabla \rho) = -\vec{v} \cdot \vec{\nabla} (\vec{\zeta}_a \cdot \vec{\nabla} \rho). \quad (125) \end{aligned}$$

Spectrum of small perturbations - PE model

Linearised equations:

Perturbations about the state of rest: $\vec{v} = 0$ with **constant stratification** on the f - plane. Linearised equations:

$$\begin{aligned}u_t - fv + \phi_x &= 0, \\v_t + fu + \phi_y &= 0,\end{aligned}\quad (126)$$

$$\begin{aligned}\phi_z + \frac{g}{\rho_0}\sigma = 0, \quad \sigma_t + w\rho'_s &= 0, \\u_x + v_y + w_z &= 0,\end{aligned}\quad (127)$$

where u, v, w - three components of velocity perturbation, ϕ - geopotential perturbation, σ - perturbation of the profile of background density ρ_s , with $\rho'_s = \text{const}$.

Vertically integrated models

Properties of the models: waves and vortices

RSW model

Primitive equations (PE)

What we lose by supposing hydrostatics

Preliminary conclusions

Physical meaning of solutions

Three roots of this equation correspond to

- ▶ Stationary solutions $\omega = 0$
- ▶ Propagative waves with dispersion relation:

$$\omega^2 = N^2 \frac{k_x^2 + k_y^2}{k_z^2} + f^2 \quad (135)$$

Internal inertia-gravity waves: IGW.

Remark: at each fixed k_z - dispersion relation of RSW
with $\sqrt{gH_0} \rightarrow \frac{N}{|k_z|}$

Exercise

1. Demonstrate (121)
2. Demonstrate that PV in the PE in isopycnal coordinates:

$$q = \frac{\partial_x v - \partial_y u + f}{\partial_\theta z} \quad (136)$$

is conserved: $\frac{dq}{dt} = 0$.

3. Demonstrate the Eulerian conservation of energy in the PE, with energy density defined as:

$$e = \rho_0 \frac{u^2 + v^2}{2} + \rho g z, \quad (137)$$

where $\rho = \rho_s + \sigma$, z - (Lagrangian) position of the elementary volume of fluid.

4. Establish polarisation relations and calculate phase and group velocities of the IGW.

Euler equations for an incompressible fluid in the rotating frame without hydrostatic hypothesis:

$$\partial_t \vec{v} + \vec{v} \cdot \vec{\nabla} \vec{v} + f \hat{z} \wedge \vec{v} = -\frac{1}{\rho_0} \vec{\nabla} P \quad \vec{\nabla} \cdot \vec{v} = 0. \quad (138)$$

Linearisation ($\rho_0 = 1$):

$$\begin{aligned} u_t - fv + P_x &= 0 \\ v_t + fu + P_y &= 0 \\ w_t + P_z = 0, \quad u_x + v_y + w_z &= 0 \end{aligned} \quad (139)$$

Solution: **inertial (gyroscopic) waves** with dispersion relation:

$$\omega^2 = f^2 \frac{k_z^2}{k_x^2 + k_y^2 + k_z^2} \quad (140)$$

→ sub-inertial.

Non-hydrostatic Boussinesq equations

$$g \frac{\rho}{\rho_0} = -\phi_z \rightarrow \frac{dw}{dt} + g \frac{\rho}{\rho_0} = -\phi_z. \quad (141)$$

Elimination of $b = -g \frac{\rho}{\rho_0}$ and w :

$$b = \phi_z + w_t, \quad -(\partial_{tt} + N^2)(u_x + v_y) + \phi_{zzt} = 0 \Rightarrow \quad (142)$$

$$u_t - fv = -\phi_x, \quad (143)$$

$$v_t + fu = -\phi_y, \quad (144)$$

$$(\partial_{tt} + N^2)(u_x + v_y) - \phi_{zzt} = 0, \quad (145)$$

Dispersion relation:

$$\omega \left[\omega^2 - \left(N^2 \frac{k^2 + l^2}{k^2 + l^2 + m^2} + f^2 \frac{m^2}{k^2 + l^2 + m^2} \right) \right] = 0 \quad (146)$$

Typically in the atmosphere and ocean

$$N^2 > f^2 \Rightarrow f^2 \leq \omega^2 \leq N^2 \quad (147)$$
