QG model

Baroclinic Rossby waves

Baroclinic
instability

Eulerian conservation

- ▶ Horizontal momentum (modulo Coriolis force), with density $\rho_0 \mathbf{v}_h$
- ▶ Mass, with density ρ
- ▶ Energy, with density

$$e = \rho_0 \frac{\mathbf{v}_h^2}{2} + \rho g Z, \quad \rho = \rho_s + \sigma, \quad (4)$$

where Z is Lagrangian position of the fluid element.

Proof of energy conservation

$$\begin{aligned} \frac{de}{dt} &= \rho_0 \mathbf{v}_h \cdot \frac{d\mathbf{v}_h}{dt} + g \frac{d\rho}{dt} Z + g \rho \frac{dZ}{dt} \\ &= -\rho_0 \mathbf{v}_h \cdot \nabla_h \phi - \rho_0 \frac{\partial \phi}{\partial Z} \mathbf{w} \equiv -\nabla \cdot (\rho_0 \mathbf{v} \phi), \quad (5) \end{aligned}$$

where hydrostatic relation between geopotential ϕ and density was used. Recalling that $\nabla \cdot \mathbf{v} = 0$, this gives:

$$\frac{\partial e}{\partial t} = -\nabla \cdot (\mathbf{v}(\rho_0 \phi - e)).$$

Baroclinic Rossby waves

Baroclinic instability

Absolute vorticity in PE

Absolute vorticity:

$$\zeta_a = \zeta + \hat{\mathbf{z}}f, \quad \nabla \cdot \zeta_a = 0, \quad (6)$$

where relative vorticity under PE scaling is:

$$\zeta = -\partial_z v \hat{\mathbf{x}} + \partial_z u \hat{\mathbf{y}} + (\partial_x v - \partial_y u) \hat{\mathbf{z}} \quad (7)$$

Application of $\nabla \wedge$ to PE + "hydrodynamic identity":

$$\mathbf{v} \cdot \nabla \mathbf{v} = \frac{1}{2} \nabla v^2 - \mathbf{v} \wedge (\nabla \wedge \mathbf{v}) \quad (8)$$

→ equation for ζ_a :

$$\begin{aligned} \frac{d\zeta_a}{dt} &= \zeta_a \cdot \nabla \mathbf{v} + \frac{g}{\rho_0} \hat{\mathbf{z}} \wedge \nabla \sigma \rightarrow \\ \frac{\partial \zeta_a}{\partial t} &= \nabla \wedge (\mathbf{v} \wedge \zeta_a) + \frac{g}{\rho_0} \hat{\mathbf{z}} \wedge \nabla \sigma. \end{aligned} \quad (9)$$

Baroclinic
instability

Conservation of potential vorticity

$$q := \zeta_a \cdot \nabla \rho, \quad \rho = \rho_s(z) + \sigma, \quad \frac{dq}{dt} = 0. \quad (10)$$

Using identities

$$\nabla \mathbf{A} \cdot (\nabla \wedge \mathbf{B}) = -\nabla \cdot (\nabla \mathbf{A} \wedge \mathbf{B}), \quad (11)$$

$$\mathbf{A} \wedge (\mathbf{B} \wedge \mathbf{C}) = \mathbf{B}(\mathbf{A} \cdot \mathbf{C}) - \mathbf{C}(\mathbf{A} \cdot \mathbf{B}), \quad (12)$$

and $\nabla \cdot \mathbf{v} = \nabla \cdot \zeta_a = 0$:

$$\begin{aligned} \partial_t (\zeta_a \cdot \nabla \rho) &= (\partial_t \zeta_a) \cdot \nabla \rho + \zeta_a \cdot \nabla (\partial_t \rho) \\ &= \nabla \rho \cdot (\nabla \wedge (\mathbf{v} \wedge \zeta_a)) - \zeta_a \cdot \nabla (\mathbf{v} \cdot \nabla \rho) \\ &= -\nabla \cdot (\nabla \rho \wedge (\mathbf{v} \wedge \zeta_a)) - \zeta_a \cdot \nabla (\mathbf{v} \cdot \nabla \rho) \\ &= -\nabla \cdot (\mathbf{v} (\zeta_a \cdot \nabla \rho)) + \nabla \cdot (\zeta_a (\mathbf{v} \cdot \nabla \rho)) \\ &\quad - \zeta_a \cdot \nabla (\mathbf{v} \cdot \nabla \rho) = -\mathbf{v} \cdot \nabla (\zeta_a \cdot \nabla \rho). \quad (13) \end{aligned}$$

Spectrum of small perturbations - PE model

Linearised equations:

Perturbations about the state of rest: $\mathbf{v} = 0$ with **constant stratification** on the f - plane. Linearised equations:

$$\begin{aligned}u_t - fv + \phi_x &= 0, \\v_t + fu + \phi_y &= 0,\end{aligned}\tag{14}$$

$$\begin{aligned}\phi_z + \frac{g}{\rho_0}\sigma = 0, \quad \sigma_t + w\rho'_s &= 0, \\u_x + v_y + w_z &= 0,\end{aligned}\tag{15}$$

where u, v, w - three components of velocity perturbation, ϕ - geopotential perturbation, σ - perturbation of the profile of background density ρ_s , with $\rho'_s = \text{const}$.

Elimination of σ and w :

Elimination of σ :

$$\phi_{zt} + wN^2 = 0, \quad (16)$$

where $N^2 = -\frac{g\rho'_s}{\rho_0}$, N - **Brunt - Väisälä frequency**

Elimination of w :

$$\begin{aligned} u_t - fv + \phi_x &= 0, \\ v_t + fu + \phi_y &= 0, \end{aligned} \quad (17)$$

$$u_x + v_y - N^{-2}\phi_{zzt} = 0, \quad (18)$$

Scaling
QG model
Baroclinic Rossby waves

Baroclinic
instability

Method of Fourier

Solutions - **harmonic waves**:

$$(u, v, \phi) = (u_0, v_0, \phi_0) e^{i(\omega t - \mathbf{k} \cdot \mathbf{x})} + \text{c.c.}, \quad (19)$$

where ω et $\mathbf{k} = (k_x, k_y, k_z)$ are frequency and wavenumber, respectively.

Algebraic system for (u_0, v_0, ϕ_0) :

$$\begin{pmatrix} i\omega & -f & -ik_x \\ f & i\omega & -ik_y \\ -ik_x & -ik_y & i\frac{\omega}{N^2} k_z^2 \end{pmatrix} \begin{pmatrix} u_0 \\ v_0 \\ \eta_0 \end{pmatrix} = 0, \quad (20)$$

Dispersion equation

Condition of solvability:

$$\det \begin{pmatrix} i\omega & -f & -ik_x \\ f & i\omega & -ik_y \\ -ik_x & -ik_y & i\frac{\omega}{N^2}k_z^2 \end{pmatrix} = 0, \quad (21)$$

which gives:

$$\omega \left(\omega^2 - \left(N^2 \frac{k_x^2 + k_y^2}{k_z^2} + f^2 \right) \right) = 0. \quad (22)$$

Conservation laws

waves

Quasi-geostrophic
approximation and
model

Scaling
QG model
Baroclinic Rossby waves

Baroclinic
instability

Physical meaning of solutions

Three roots of this equation correspond to

- ▶ Stationary solutions $\omega = 0$
- ▶ Propagative waves with dispersion relation:

$$\omega^2 = N^2 \frac{k_x^2 + k_y^2}{k_z^2} + f^2 \quad (23)$$

Internal inertia-gravity waves: IGW.

Remark: at each fixed k_z - dispersion relation of RSW with $\sqrt{gH_0} \rightarrow \frac{N}{|k_z|}$

Baroclinic
instability

Non-hydrostatic Boussinesq equations

$$g \frac{\sigma}{\rho_0} = -\phi_z \rightarrow \frac{dw}{dt} + g \frac{\sigma}{\rho_0} = -\phi_z. \quad (24)$$

Elimination of $b = -g \frac{\sigma}{\rho_0}$ and w :

$$b = \phi_z + w_t, \quad -(\partial_{tt} + N^2)(u_x + v_y) + \phi_{zzt} = 0 \Rightarrow \quad (25)$$

$$u_t - fv = -\phi_x, \quad (26)$$

$$v_t + fu = -\phi_y, \quad (27)$$

$$(\partial_{tt} + N^2)(u_x + v_y) - \phi_{zzt} = 0, \quad (28)$$

Dispersion relation:

$$\omega \left[\omega^2 - \left(N^2 \frac{k_x^2 + k_y^2}{k_x^2 + k_y^2 + k_z^2} + f^2 \frac{k_z^2}{k_x^2 + k_y^2 + k_z^2} \right) \right] = 0 \quad (29)$$

Typically in the atmosphere and ocean

$$N^2 > f^2 \Rightarrow f^2 \leq \omega^2 \leq N^2 \quad (30)$$

Parameters

- ▶ Rossby number: $Ro = \frac{U}{f_0 L} \equiv \epsilon$
- ▶ Typical dimensionless deviation of the isopycnal surfaces: λ
- ▶ Dimensionless gradient of the Coriolis parameter: $\tilde{\beta}$
- ▶ Stratification parameter:
$$S = \frac{\text{variable part of density}}{\text{constant part of density}}$$
- ▶ Burger number: $Bu = \frac{R_d^2}{L^2}$, where R_d **baroclinic** deformation radius with **reduced gravity** $g' = Sg$.

Pressure and density related via hydrostatics:

$$\begin{aligned}\rho &= \rho_0 [1 + S(\rho_s(z) + \lambda\sigma(x, y, z; t))], \Rightarrow \\ P &= \rho_0 g H [(1 - z) + S(\rho_s(z) + \lambda\pi(x, y, z; t))] \quad (31)\end{aligned}$$

Thermal wind

QG regime

$$\lambda \sim \tilde{\beta} \sim \epsilon \ll 1, \quad \Rightarrow \quad L \sim R_d, \quad \frac{W}{H} = \lambda \frac{U}{L}. \quad (37)$$

Leading order in small parameters

Geostrophic + hydrostatic equilibria:

$$u = -\partial_y \pi, \quad v = \partial_x \pi, \quad \sigma = -\partial_z \pi \Rightarrow \partial_z v = -\partial_x \sigma, \quad \partial_z u = +\partial_y \sigma \quad (38)$$

Horizontal density gradient \leftrightarrow vertical shear of the horizontal velocity. Atmosphere: $\sigma \rightarrow -\theta$.

Leading-order vertical velocity:

$$w = -\frac{1}{\rho'_s(z)} \frac{d_g \sigma}{dt} = \frac{1}{\rho'_s(z)} \frac{d_g \partial_z \pi}{dt}, \quad (39)$$

where $\frac{d_g}{dt} = \partial_t + \partial_x \pi \partial_y - \partial_y \pi \partial_x$ - geostrophic advection.
